

Browser-Cache

Why do we clear the browser cache?

The cache stores website information in order to load the web pages faster. So when you call up a website again, the browser uses the cache information to avoid having to download and process the page again.

This saves loading time but ensures that information on the page is not always up-to-date.

The data also takes up memory space.

By clearing the cache, this storage is removed and the browser is forced to retrieve the page again.

This refreshes the page and helps to correct temporary errors and display updates that were previously hidden.

In web-based applications, the files stored in the cache prevent current content from being displayed. Instead, the outdated data stored in the cache is loaded.

If the cache is cleared, the latest version of the page can be reloaded when the browser is restarted.

How to proceed

For example Chrome Browser:
